- ◀ COVER. The figure illustrates the reversible photo-switching mechanism of photoswitchable fluorescent proteins used for nanoscopic imaging. Photoswitching fluorescent proteins are the key components for nanoscopy, which allowed to achieve images well below the diffraction limit of light. The images shown in the background are wide-field and its corresponding superresolution image of actin bundle-filament obtained with PALM microscopy using Kohinoor photoswitchable fluorescent protein. See page 714.
