## ANNOUNCEMENT

---

### THE INSTITUTE OF METALS LAUNCHES MATERIALS '87

In a major new initiative, The Institute of Metals is developing a series of international conferences and associated exhibitions in the field of materials engineering. The first of these events will be **MATERIALS '87—Processing and property control**, to be held in London 13–15 May 1987.

**MATERIALS '87**, organised in association with a number of other bodies, will bring together an international gathering of scientists, technologists and engineers from industry and the academic world, concerned with the control of materials structure and properties through processing.

An important aim of the conference is cross fertilisation between the different specialist fields dealing with metals, ceramics, polymers and composites. A

comprehensive programme of keynote addresses and papers presenting the results of research and development will enable delegates to broaden their knowledge of materials outside their specialist spheres. Subjects covered will range from fundamental considerations of structure and property control to technological aspects of materials process engineering.

Papers are invited by The Institute of Metals in the following seven process areas: Solidification, Powder processing, Mechanical and thermal processing, Surface Engineering, Joining, Production and processing of composites, Electronic materials processing. For details please contact Keith Wakelam, 1, Carlton House Terrace, London SW1Y 5DB, England.
